Isolation, NMR and Mass Characterization of Ducose - A Novel Tetrasaccharide from Goat Milk

Pushpraj Singh
Department of Chemistry, Govt. Girls Degree College, Chhibramau, Kannaui-209721, Uttar Pradesh, India

ABSTRACT

Milk is an excellent source of all the necessary nutrients in the proper proportions. Besides the other regular constituents it has oligosaccharides in it which are indigestible by the infant yet are consumed by the microbial populations in the developing intestine. These oligosaccharides are believed to facilitate enrichment of a healthy infant gastrointestinal microbiota, often associated with bifidobacteria. Goat milk is a rich source of oligosaccharides that have enormous biological activities such as antibacterial, immunological, anti-inflammatory, hypoallergenic and therapeutic properties. It is used against tuberculosis in folk medicine and also helps in the enhancement of platelet count during dengue fever. Goat milk oligosaccharides have anti-inflammatory properties and are involved in the repairing process after a dextran sodium sulphate-induced colitis. Keeping in mind the biological importance of goat milk and the role of oligosaccharides, in the present studies, goat milk was analyzed for its oligosaccharide content which led to the isolation of a novel tetrasaccharide, ducose, \( \text{C}_{28}\text{H}_{48}\text{O}_{21}\text{N}_{2} \). The structure of the isolated oligosaccharide was elucidated by chemical transformation, chemical degradation, \(^1\text{H}, \text{C}, \text{2D-NMR (COSY, TOCSY, HMBC and HSQC)}\) and mass spectrometry as under.

The geometry of compound ducose was optimized by B3LYP method and 6-31 G (d,p) basis set.

Keywords: Goat milk, carbohydrates, oligosaccharides, tetrasaccharide, ducose.

INTRODUCTION

Milk is nature’s gift to mankind that has everything a baby needs for easy digestion, brain development, protection from illness, allergies and infections. Milk contains several different carbohydrates including lactose, glucose, galactose and other oligosaccharides. Oligosaccharides, that are the third most abundant complex compounds present in milk or colostrum of mammalian species, play a key role in various physiological, pathological and biological activities such as biological recognition, anti-complementary, anti-coagulant, anti-inflammatory, anti-viral, anti-bacterial, anti-tumor, anti-oxidant, lipid lowering, immunological, prebiotic and hypoglycemic activities. Oligosaccharides play a critical role in preventing inflammatory processes, reducing diabetes, obesity and cardiovascular risks, modulating the gut flora and affecting different gastrointestinal activities. Goat milk oligosaccharides have anti-inflammatory effects in rats with trinitrobenzenesulfonic (T) acid-induced colitis and may be useful in the management of inflammatory bowel disease. Goat milk oligosaccharides play an important role in intestinal protection and repair after damage caused by DSS (dextran sodium sulphate)-induced colitis and their implication in human intestinal...
Goat milk possesses anti-hypertensive and immunomodulatory properties\(^{11-12}\). In view of the above facts, we have chosen to investigate goat milk for its oligosaccharide constituents and their structure elucidation. For this purpose, goat milk was collected in bulk and was processed by the modified method of Kobata and Ginsburg involving deproteination, filtration, lyophilization followed by gel filtration, HPLC and column chromatography. We are describing the structure elucidation of one novel goat milk oligosaccharide, ducose and its Density Functional Theory (DFT) studies.

**Theoretical Study**

The quantum chemical calculations have been performed on B3LYP functional and 6-31G (d,p) basis set employing DFT. Geometry of compound ducose was first optimized and the presence of positive wave number values for all the optimized geometry indicated the stability of the compound. All computations were performed using the Gaussian 09 program package\(^{14}\).

**Experimental**

**General procedures**

The sugars were visualized on TLC with 50% aqueous \(\text{H}_2\text{SO}_4\) reagent and on paper chromatography (PC) with acetyl acetone and \(p\)-dimethylaminobenzaldehyde reagents. The absorbent for TLC was silica gel G (SRL) and CC silica gel (SRL, 60-120 mesh). PC was performed on Whatman No.1 filter paper using solvent system of toluene, butanol and water in varied proportions. Sephadex G-25 (PHARMACIA) was used in gel permeation chromatography. Freeze drying of the oligosaccharide mixture was done with the help of CT-60e (HETO) lyophylizer and centrifuged by a cooling centrifuge Remi instrument C-23 JJRCI 763. To check the homogeneity of the compounds reverse phase HPLC system was used equipped with Perkin Elmer 250 solvent delivering system, 235 diod array detector and G.P. 100 printer plotter. Authentic samples of \(N\)-acetylgalactosamine (\(\text{GalNAc}\)), galactose (\(\text{Gal}\)), glucose (\(\text{Glc}\)), were purchased from Aldrich Chemicals. Optical rotations were measured with a AA-5 series automatic polarimeter in 1cm tube. \(^1\)H and \(^13\)C NMR spectra of the oligosaccharide were recorded in \(\text{D}_2\text{O}\) and the spectra of the acetylated oligosaccharide was recorded in \(\text{CDCl}_3\) at 25°C on a Bruker AM 300 FT NMR spectrometer.

The electrospray mass spectra were recorded on a MICROMASS QUATTRO II triple quadrupole mass spectrometer. The samples (dissolved in suitable solvents such as methanol/acetoniirile/water) were introduced into the ESI source through a syringe pump at the rate 5\(\mu\)L per min. The ESI capillary was set at 3.5 KV and the cone voltage was 40V. The spectra were collected in 6s scans and the print outs were averaged spectra of 6-8 scans. The C, H and N analyses were recorded on CARLO-ELBA 1108 an elemental analyzer.

Isolation of goat milk oligosaccharides by modified method of Kobata and Ginsburg\(^{15}\)

11 Litres of goat milk was collected in 15 days with normal milking condition from a single domestic goat (Battisi) from Nagla Seth village, Shamsabad, Farrukhabad District, Uttar Pradesh, India. The milk was fixed by addition of equal amount of ethanol (11 L), the preserved milk was taken to laboratory and there it was centrifuged for 15 min at 5000 rpm at 4°C. The solidified lipid layer was removed by filtration through glass wool column under cold atmospheric condition. More ethanol was added to clear filtrate to a final concentration of 68% and the resulting solution was left over night at 0°C. The white precipitate formed mainly of lactose and protein was removed by centrifugation and washed twice with 68% ethanol at 0°C. The supernatant and the washings were combined and filtered through a micro filter and lyophilized affording 215 g of crude oligosaccharide mixture.

**Sephadex G-25 gel filtration of goat milk oligosaccharide mixture**

13.20 g of lyophilized material (mixture of oligosaccharides) of goat milk was purified on Sephadex G-25 column chromatography for the separation of oligosaccharides from other constituents of milk by using glass triple distilled water as eluent at a flow rate of 3 ml/min. Goat milk oligosaccharide mixture was packed in a column (1.6x40 cm) (void volume = 25 ml) equilibrated with glass triple distilled water (TDW) and it was left for 10-12 h to settle down. Presence of neutral sugars was monitored in all the eluted fractions by phenol-sulphuric acid test. In this experiment the UV-monitored Sephadex G-25 chromatography of goat milk oligosaccharide mixture showed seven peaks \(i.e.\ I, II, III, IV, V, VI and VII.\) A substantial amount of proteins, glycoproteins and serum albumin were eluted in the void volume that was confirmed by positive coloration with \(p\)-dimethylaminobenzaldehyde reagent and phenol-sulphuric acid reagent\(^{16}\). Fractions under peaks II, III and IV gave a positive phenol-sulphuric acid test for sugars, which showed the presence of oligosaccharide mixture in the goat milk. These fractions under peaks II, III and IV were pooled and lyophilized together affording 8.6 g of oligosaccharide mixture.

The amount of oligosaccharide mixture of the pooled fractions (peaks II, III and IV) obtained from Sephadex G-25 column chromatography was 8.6 g. This process was repeated further, which resulted into a total of 14.35 g of the oligosaccharide mixture.

**Confirmation of homogeneity of goat milk oligosaccharides by reverse phase HPLC**

Pooled fractions (peaks II, III and IV) obtained from Sephadex G-25 column, containing oligosaccharide mixture were qualitatively analyzed by reverse phase HPLC. The HPLC system was equipped with Shimadzu CLASS-VP V6.13 solvent delivering system, 235-diode array detector and G.P. 100 printer plotter. The column used for this purpose was C18 Purosphere 25 cm × 0.4 cm × 5-μm (from E. Merck). A binary gradient system of acetonitrile: 0.5% trifluoro-acetic acid (5:95) in triple distilled water (TDW) to CH₃CN: 0.5% TFA (60:40) within 25 min at a flow rate of 1 ml/min was used. The eluents were detected at 220 nm. Twelve peaks were noticed in the sample (pooled fraction II and III) at the varied retention times from 1.592 min to 20.675 min, for convenience the peaks were numbered in their increasing order of retention time i.e. [0.299(R₁), 1.323(R₂), 2.272(R₃), 3.093(R₄), 3.605(R₅), 3.968(R₆), 4.320(R₇), 5.067(R₈), 5.483(R₉), 5.728(R₁₀), 5.877(R₁₁) and 6.165(R₁₂)].

**Graph 2:** Reverse phase HPLC of goat milk oligosaccharides (For the chromatographic conditions, see Tables 1 and 2)
Acetylation of the oligosaccharide mixture

11 g Oligosaccharide mixture obtained from Sephadex chromatography was acetylated with pyridine (11 ml) and acetic anhydride (11 ml) at 60 °C and the solution was stirred overnight. Further in order to remove the excess reagents, the reaction mixture was evaporated under reduced pressure and the viscous residue was taken up in CHCl₃ (200 ml) and washed twice with ice-cold water, evaporated to dryness yielding acetylated mixture (12.30 g). The acetylation converted the free sugars into their non-polar acetyl derivatives which were resolved nicely on TLC giving 10 spots i.e. a, b, c, d, e, f, g, h, i and j. Detection of the spots on TLC was done by spraying with 50% H₂SO₄ in distilled water and heating. Varied proportions of CHCl₃:MeOH was used as chromatography solvent.

Purification of acetylated milk oligosaccharide on silica gel column

Purification of the acetylated oligosaccharide mixture (11.0 g) was carried out over silica gel (500 g) using varied proportion of Hex:CHCl₃, CHCl₃, CHCl₃:MeOH as eluents, collecting fraction of 500 ml each. All these fractions were checked on TLC and the fractions showing similar spots (Rf values) were collected together for further investigations. Repeated column, chromatography of fractions I and II, led to the isolation of one chromatographically pure compound 'b' ducose (308 mg).

Deacetylation of Compound 'b'

Acetylated compound 'b' (50 mg) was dissolved in acetone (3 ml) and 3 ml of NH₄ was added to it and was left overnight in a stoppered hydrolysis flask. After 24 h ammonia was removed under reduced pressure and the compound was washed with (3 x 5 ml) CHCl₃ (to remove acetamide) and the water layer was finally freeze dried giving the natural oligosaccharide 'B' ducose (39 mg).

Methyl glycosidation/acid hydrolysis of compound 'B', ducose

Compound 'B' ducose (8 mg) was refluxed with absolute MeOH (2 ml) at 70 °C for 18 h in the presence of cation exchange IR-120 (H⁺) resin. The reaction mixture was filtered while hot and filtrate was concentrated giving methyl glycoside of compound 'B'. In the solution of methyl glycoside of compound 'B', 1, 4-dioxane (1 ml), and 0.1N H₂SO₄ (1 ml) were added and the solution was warmed for 30 min at 50°C. The hydrolysis was complete after 24 h. The hydrolysate was neutralized with freshly prepared BaCO₃, filtered and concentrated under reduced pressure to afford α- and β-methyl glycosides along with Gal and GalNAc. Their identification was confirmed by comparison with authentic samples of α-and β-methyl glycosides, Gal and GalNAc (TLC, PC).

Kilian hydrololysis of compound 'B', ducose

Compound 'B' ducose (5 mg) was dissolved in 2 ml Kiliani mixture (AcOH-H₂O-HCl, 7:11:2) and heated at 100°C for 1 h followed by evaporation under reduced pressure. It was dissolved in 2 ml of H₂O and extracted twice with 3 ml CHCl₃. The aqueous residual solution was made neutral by addition of 1-2 drops of 2N NaOH and was evaporated under reduced pressure to afford Glc, Gal and GalNAc which were compared by authentic samples of Glc, Gal and GalNAc, respectively.

Description of Compound 'B' ducose

Acetylated ducose 'b' (308 mg) was obtained from column chromatography. On deacetylation of 50 mg of compound ducose acetate 'b' with NH₄acetone, it afforded compound ‘B’ (39 mg) [α]D²⁵ = -17° (c 1% H₂O). For experimental analysis, this compound was dried over P₂O₅ at 100°C and 0.1 mm pressure for 8 hr. It gave positive Phenol-sulphuric acid test, Feigl test and Morgan-Elson test.

ES Mass of Compound ‘B’, Ducose

RESULT AND DISCUSSION

Stability of molecular geometry of isolated compound 'B' ducose

Density functional theory (DFT), a computational method, was employed to evaluate the structure-activity relationship. In this study, the geometry of compound ducose was optimized at B3LYP method and 6-31 G (d,p) basis set using Gaussian 09 program package. The molecular geometries can be determined by the quantum mechanical behavior of the electrons and computed by ab-initio quantum chemistry methods to high accuracy. Molecular geometry represents the three-dimensional arrangement of the atoms that determines several properties of a substance including its reactivity, polarity, phase of matter, color, magnetism, and biological activity. The compound ‘B’ was found to be highly polar in
nature with the total dipole moment of 11.3017 Debye. The total energy of compound was -2785.0912 a.u., which represents the stability of molecule. All the rings were present in the most stable chair form. The compound 'B' ducose possesses C₁ symmetry. The optimized structure of compound is given below (Figure 1).

Structure elucidation of isolated goat milk oligosaccharide ducose ('B')

NMR Spectroscopy

The structure of the novel milk oligosaccharide, compound 'B' ducose was elucidated with the help of chemical degradation, chemical transformation, spectroscopic techniques like NMR (¹H, ¹³C and 2D-NMR), structure reporter group theory and mass spectrometry. In the present study, analogies between chemical shift of certain 'structural reporter group resonances' were used to make proton resonance assignments as well as structural assignments of the oligosaccharides by comparing the ¹H NMR data of acetylated oligosaccharides and natural oligosaccharides. The ¹H NMR assignments were made by interpretation of data of COSY, TOCSY, HSQC and HMBC experiments.

Compound ‘B’ Ducose, C₂₈H₄₂O₂₁N₂ [α]°D = -17°, isolated by repeated column chromatography of the oligosaccharide mixture, obtained from Goat milk, gave positive Phenol-sulphuric acid test, Feigl test, Morgan-Elson test showing the presence of normal and amino sugar(s) in the compound. The ¹H NMR spectrum of acetylated Ducose ‘b’ in CDCl₃ at 300 MHz exhibited four doublets for five anomeric protons at δ6.24(1H), δ5.68(1H), δ4.51(2H) and δ4.48(1H) indicating that Ducose ‘B’ may be a tetrasaccharide in its reducing form giving signals for α and β- anomers at the reducing end. The tetrasaccharide nature of Ducose acetate ‘b’ was further confirmed by the presence of four signals for five anomic carbons at δ88.83(1C), δ91.41(1C), δ100.77 (2C) and δ101.01(1C) in ¹³C NMR of acetylated Ducose ‘b’ at 300 MHz in CDCl₃. Moreover the tetrasaccharide nature of Ducose ‘B’ was supported by the presence of four anomic proton doublets for five anomic protons at δ5.59(1H), δ5.53(1H), δ4.38(2H), and δ4.31(1H) in ¹H NMR spectrum of compound Ducose ‘B’ in D₂O at 300 MHz. The reducing nature of compound Ducose ‘B’ was again confirmed by its methyl glycosylation followed by its acid hydrolysis (MeOH/H⁺), which led to the isolation of α and β-methyl glucosides, along with Gal and GalNAc suggesting the presence of glucose at the reducing end and presence of Gal and GalNAc in the Ducose ‘B’. The HSQC spectrum of acetylated compound Ducose ‘b’ at 300 MHz in CDCl₃ showed the presence of four cross peaks of five anomic protons and carbons in their respective region at δ6.24x88.83, δ5.68x91.41, δ4.51x100.77 and δ4.48x101.01 suggesting that compound Ducose ‘B’ must be a tetrasaccharide in its reducing form. Thus ¹H and ¹³C NMR spectra of acetylated Ducose ‘b’ justify the five anomic signals for tetrasaccharide with total integral intensity of four anomic protons/carbons. For convenience, starting from reducing end, the monosaccharides present in compound Ducose ‘B’ have been designated as S-1, S-2, S-3 and S-4. To confirm the monosaccharide constituents in compound Ducose ‘B’, it was hydrolyzed under strong acidic conditions of Kiliani hydrolysis which gave three monosaccharides i.e. Glc, Gal and GalNAc which were found identical with the authentic samples of Glc, Gal and GalNAc by co-chromatography (TLC and PC), confirming that the tetrasaccharide compound Ducose ‘B’ was consist of three types of monosaccharide units i.e. Glc, Gal and GalNAc.
The molecular formula C_{29}H_{40}O_{21}N_{2} was in agreement with mass ion peak obtained from ES-MS spectrum of compound Ducose ‘B’ which showed the highest mass ion peak at m/z 748 [M] for a tetrascarabcar. The 1H NMR spectrum of compound Ducose ‘B’ in D_{2}O at 300 MHz contain two anomeric proton doublets at δ6.59 (d, J=3.9 Hz) and δ4.53 (d, J= 8.4Hz) for α and β-anomers of reducing monosaccharides (S-1) i.e. Glc. The 1H NMR spectrum of Ducose acetate ‘b’ in CDCl_{3} at 300 MHz contain two anomeric proton doublets at δ6.24 (d, J=3.3 Hz) and δ5.68 (d, J= 8.1 Hz) for α and β-anomers of reducing monosaccharides (S-1) i.e. Glc. The anomeric protons signal present at δ6.68 in TOCSY Spectrum of Ducose acetate ‘b’ assigned to β-Glc (S-1) gave three cross peaks at δ5.68x5.03, δ5.68x5.27and δ5.68x3.83, which was later identified as H-2, H-3 and H-4of reducing Glc respectively by COSY spectrum of acetylated Ducose ‘b’ at 300 MHz in CDCl_{3}. The chemical shift of H-4 of S-1 at δ3.83 suggested that H-4 of S-1 was available for glycosidic linkage by next monosaccharide unit. Further the 1H NMR signal present at δ3.83 assigned to H-4 of reducing Glc (S-1) gave a cross peak at δ3.83x100.77 in HMBC spectrum of Ducose acetate ‘b’ which was between H-4 of reducing Glc and C-1 of S-2, confirmed a (1→4) linkage between Glc (S-1) and S-2. The anomeric carbon of S-2 at δ101.77 gave its complimentary anomeric proton signal at δ4.51(7.5 Hz) in the HSQC spectrum of Ducose acetate ‘b’. The chemical shift values of anomeric carbon at δ100.77 and anomeric proton at δ4.51 were having resemblance with literature value of anomeric chemical shift value of GalNAc hence S-2 was confirmed as GalNAc. Further the coupling constant of anomeric signal (S-2) at δ4.51 with larger J value of 7.5 Hz confirmed the β-configuration of the glycosidic linkage between (S2→S1) in Ducose acetate ‘b’. Moreover the presence of β-GalNAc as next monosaccharide in Ducose ‘B’ was confirmed by appearance of anomeric proton signal at δ4.38(7.8 Hz) along with a singlet of three protons at δ1.95 in 1H NMR spectrum of Ducose ‘B’ in D_{2}O at 300 MHz. Further the anomeric proton signal at δ4.51 assigned to S-2(β-GalNAc) showed three cross peaks at δ4.51x4.07, δ4.51x3.88 and δ4.51x5.21 in the TOCSY spectrum of Ducose acetate at 300 MHz which was later identified as H-2, H-3 and H-4 of β-GalNAc (S-2) respectively by COSY spectrum of acetylated Ducose ‘b’ in CDCl_{3} at 300 MHz.

The chemical shift of H-2 of S-2 at δ4.07 was due to presence of NHCOCH_{3} at C-2 of S-2 (β-GalNAc) and the chemical shift of H-3 of S-2 at δ3.88 showed the availability of -OH group for glycosidic linkage by next monosaccharide unit i.e. S-3. Further the 1H NMR signal present at δ3.88 assigned to H-3 of β-GalNAc (S-2) gave a cross peak at δ3.88x100.77 in HMBC spectrum of Ducose acetate ‘b’ which was between H-3of β-GalNAc (S-2) and C-1 of S-3 confirmed a 1→3 linkage between S-2 and S-3. The anomeric carbon of S-3 at δ100.77 gave its complimentary anomeric proton signal at δ4.51 in the HSQC spectrum of Ducose acetate ‘b’. The chemical shift values of anomeric carbon at δ100.77 and anomeric proton at δ4.51 were having resemblance with literature value of anomeric chemical shift value of Gal, confirming that S-3 was Gal. Further the coupling constant of anomeric signal of S-3 at δ4.51 with larger J value of 7.5 Hz confirmed the β-configuration of the glycosidic linkage between (S3→S2) in Ducose acetate ‘b’. Further the presence of β-Gal as next monosaccharide in Ducose ‘B’ was confirmed by appearance of anomeric proton doublet at δ4.38 (7.8 Hz) in 1H NMR spectrum of Ducose acetate ‘B’ in D_{2}O at 300 MHz. Further the anomeric proton signal at δ4.51 (7.5 Hz) assigned for β-Gal (S-3) showed three cross peaks at δ4.51x5.13, δ4.51x5.41 and δ4.51x3.82in the TOCSY spectrum of acetylated Ducose ‘b’ which was later identified as H-2, H-3 and H-4 of β-Gal (S-3) respectively by COSY spectrum of acetylated Ducose ‘b’ in CDCl_{3} at 300 MHz.

The chemical shift at δ3.82 assigned to H-4 of sugar S-3 showed the availability of OH group for glycosidic linkage by next monosaccharide unit i.e. S-4. Further the HMBC spectrum of Ducose acetate ‘b’ at 300 MHz showed a cross peak signal of H-4 of β-Gal (S-3) and anomeric carbon of next monosaccharide C-1of S-4 at δ3.82x101.01 confirmed a (1→4) linkage between S-4 and S-3. The anomeric carbon at δ101.01 gave its complimentary anomeric proton signal at δ4.48 in the HSQC spectrum of acetylated Ducose ‘b’. The chemical shift values of anomeric carbon at δ101.01 and anomeric proton at δ4.48 were having resemblance with literature value of anomeric chemical shift value of GalNAc, confirming that S-4 was GalNAc. The coupling constant of anomeric signal (S-4) at δ4.48 with larger J value of 8.7 Hz confirmed the β-configuration of the glycosidic linkage between (S4→S3) in Ducose acetate ‘b’. Further the presence of β-GalNAc as next monosaccharide in Ducose ‘B’ was confirmed by appearance of anomeric proton signal at δ4.31(7.2 Hz) along with a singlet of three protons at δ2.08 in 1H NMR spectrum of Ducose acetate ‘B’ in D_{2}O. The anomeric proton signal at δ4.48(8.7 Hz) assigned to β-GalNAc (S-4) gave three cross peaks at δ4.48x3.90, δ4.48x5.40 and δ4.48x5.02 in the TOCSY spectrum of Ducose acetate ‘b’ which was later identified as H-2, H-3 and H-4 of β-GalNAc (S-4) respectively by COSY spectrum of acetylated Ducose ‘b’ in CDCl_{3} at 300 MHz. The chemical shift of H-2 of S-4 at δ3.90 was due to NHCOCH_{3} at C-2 of S-4. Since The chemical shift values of ring protons of S-4 at δ5.40 and δ5.02 does not reside in the...
linkage region and hence they did not show any cross peak in the linkage region i.e. 63.5-4.2 ppm confirming that β-GalNAc (S-4) was present at non-reducing end and none of its -OH group were available for glycosidic linkage, which was confirmed by the TOCSY and COSY spectra of acetylated Ducose ‘b’ in CDCl$_3$ at 300 MHz. All the $^1$H NMR assignments for ring protons of monosaccharide units of Ducose ‘B’ were confirmed by COSY and TOCSY experiments. The positions of glycosidation in the oligosaccharide were confirmed by position of anomeric signals, Structure reporter groups (SRG) and comparing the signals in $^1$H and $^{13}$C NMR of acetylated and deacetylated oligosaccharide. The glycosidic linkages in Ducose ‘B’ were assigned by the cross peaks for glycosidically linked carbons with their protons in the HSQC and HMBC spectra of Ducose acetate ‘b’. All the $^1$H NMR assignments for ring protons of monosaccharide units of Ducose ‘B’ were confirmed by COSY and TOCSY experiments. The positions of glycosidation in the oligosaccharide were confirmed by position of anomeric signals, Structure reporter groups (SRG) and comparing the signals in $^1$H and $^{13}$C NMR of acetylated and deacetylated oligosaccharide. The glycosidic linkages in Ducose ‘B’ were assigned by the cross peaks for glycosidically linked carbons with their protons in the HSQC and HMBC spectra of Ducose acetate ‘b’. All the $^1$H NMR assignments for ring protons of monosaccharide units of Ducose ‘B’ were in conformity with the assigned structure and their positions were confirmed by 2D NMR viz. COSY, TOCSY, HSQC and HMBC experiments of Ducose acetate ‘b’. Thus based on the pattern of chemical shifts of $^1$H NMR, $^{13}$C NMR, COSY, TOCSY, HSQC and HMBC experiments, it was interpreted that the compound Ducose ‘B’, was a tetrasaccharide having the following structure:

$\beta$-GalNAc(1→4)-$\beta$-Gal(1→3)-$\beta$-GalNAc(1→4)Glc

The Electrospray Mass Spectrometry data of compound Ducose ‘B’ not only confirmed the derived structure of Ducose ‘B’ but also supported the sequences of monosaccharides in this compound. The highest mass ion peak were recorded at m/z 787 and at m/z 771 which were due to [M+K]$^+$ and [M+Na]$^+$. It also contains the molecular ion peak at m/z 748 confirming the molecular weight of Ducose ‘B’ as 748[M]$^+$ and was in agreement with its molecular formula C$_{28}$H$_{48}$O$_{21}$N$_2$. Further the mass fragments were formed by repeated H$^+$ transfer in the oligosaccharide and was accompanied by the elimination of terminal sugar less water. The tetraasaccharide Ducose ‘B’ m/z 748(I) fragmented to give mass ion peak at m/z 545(II) [748-S$_4$], this fragment was arised due to the loss of terminal $\beta$-GalNAc (S$_4$) (203) moiety from tetrasaccharide indicating the presence of $\beta$-GalNAc (S$_4$) at the non-reducing end. It was further fragmented to give mass ion peak at m/z 383(III) [545-S$_3$] which was due to loss of $\beta$-Gal (S$_3$) (162) moiety from trisaccharide. This fragment of 383 was further fragmented to give mass ion peak at m/z 180(IV) [383-S$_2$] which was due to loss of $\beta$-GalNAc (S$_2$) (203) moiety from the disaccharide. The other fragmentation pathway in ES Mass spectrum of Ducose ‘B’, m/z 748 shows the mass ion peak at 690[748-NHCOCH$_3$], 652[690-2H$_2$O$^+$], 651[652-H$^+$], 545[748-S$_4$], 503[545-CH$_2$CO], 481[545-HCHO-2OH], 465[503-2H$_2$O$^+$], 421[465-CH$_2$CHO], 406[461-CH$_2$CHO-CH$_2$OH], 383[545-S$_3$], 325[383-NHCOCH$_3$], 319[383-HCHO-2OH], 301[319-H$_2$O], 259[325-HCHO-2H$_2$O], 223[259-2H$_2$O] and 180[383-S$_2$].

Scheme 2: Mass fragmentation pattern of ducose observed
Based on result obtained from chemical degradation/acid hydrolysis, Chemical transformation, Electro spray mass spectrometry and 1D-NMR viz. 1H NMR, 13C NMR, Structure Reporter Groups (SRGs) and 2D-NMR viz. COSY, TOCSY, HMBC and HSQC spectra of Ducose acetate ‘b’ and Ducose ‘B’. the structure and sequence of isolated a novel oligosaccharide was deduced as:

Structure of the isolated compound ‘B’, ducose

CONCLUSION

In summary, we conclude that the structure of the isolated goat milk novel oligosaccharide, compound ‘B’, ducose is being reported for the first time from any natural source/any milk and was elucidated with the help of 1H, 13C, 2D NMR spectroscopy and mass spectrometry. Using Gaussian 09 program at B3LYP method and 6-31 G basis set, the geometry of compound ‘B’ ducose has been optimized.

ACKNOWLEDGMENTS

Author is thankful to the Head, Department of Chemistry, Lucknow University for providing the NMR facilities, CDRI Lucknow for successfully running Mass experiments and Dr. Desh Deepak, Associate Professor, Department of Chemistry, Lucknow University for moral support and encouragement.
